The strength and durability of concrete walls formed with ICFs offer unmatched resistance to damage from tornados and major storms.

One home – still under construction but built with ICF walls – was still standing after a F-3 class tornado tore through Greenbriar Estates in Stoughton. The structure was under roof, with windows installed and brick cladding begun.

Engineering analysis showed the ICF walls were not damaged and had not moved. Construction was resumed on the 3-story home as soon as debris had been cleared from the development. Debris from the storm was found 75 miles east of Stoughton (flying debris is the primary cause of injuries and fatalities during tornados and storms).

ICF homes are less likely to suffer major damage from debris than conventionally framed houses. This greater measure of built-in safety reduces insurance premiums and makes ICF construction the safe, quality choice for your new home.
